IMPORTANT: Provide all supporting documentation that this water body is important for the spawning, rearing or migration of anadromous fish, including: number of fish and life stages observed; sampling methods, sampling duration and area sampled; copies of field notes; etc. Attach a copy of a map showing location of mouth and observed upper extent of each species, as well as other information such as: specific stream reaches observed as spawning or rearing habitat; locations, types, and heights of any barriers; etc.

Comments: The following observations were made during a Forest Practices Inspection on August 14, 1997. This is a small tributary that comes in from the north of the mainstem of ADF&G Stream #110-17-10072 that has dark water, a flat grade, silty substrate and is incised into a thick vegetated bank. It appears to end less than 100 feet above the proposed crossing of logging spur road 4610 and is approximately 200 yards above the confluence with the mainstem. A large juvenile coho salmon was captured at the crossing location with the electroshocker. This tributary appears to contain rearing habitat only. *Electroshocking occurred for less than one minute, just enough time to document anadromous fish use. Time prevented further sampling. The purpose was to document anadromous fish usage for FPA protection MK*
